1 Tensor Product of Modules

Definition 1.1 (R-balanced Maps). Let R be a ring, with M a right R-module, N a left R-module and P an abelian group. Then the map $\varphi: M \times N$ is \mathbf{R} -balanced if the followings are satisfied:

- $\varphi(u, v_1 + v_2) = \varphi(u, v_1) + \varphi(u, v_2)$ for all $u \in M, v_1, v_2 \in N$.
- $\varphi(u_1 + u_2, v) = \varphi(u_1, v) + \varphi(u_2, v)$ for all $u_1, u_2 \in M$, $v \in N$.
- $\varphi(ua, v) = \varphi(u, av)$ for all $a \in R, u \in M, b \in N$.

Remark 1.1. The only difference between R-balanced maps and R-linear maps is the third condition: the coefficient in R could be transferred between different positions, but not out of the expression.

Definition 1.2 (Tensor Product). A **tensor product** of M and N is an abelian group $M \otimes_R N$ with an R-balanced map $\varphi : M \times N \to M \otimes_R N$ which is universal w.r.t. the property: i.e. $\forall \psi : M \times N \to P$ which is R-balanced, there exists a unique $f : M \otimes_R N \to P$ s.t. $\psi = f \circ \varphi$ (ψ factors uniquely through φ), i.e. the following diagram commute:

Remark 1.2. If \otimes_R exists, then it is unique up to a canonical isomorphism.

Suppose that for $M, N \in {}_R\underline{\text{Mod}}$, there exists two tensor products T and T'. Denote the canonical map from $M \times N$ to T and T' be φ and φ' , respectively. Then by universal property of tensor product, there exists a unique isomorphism f and f' s.t. $f \circ \varphi = \varphi'$ and $f' \circ \varphi' = \varphi$, which gives $f \circ f' = \operatorname{Id}$.

Proposition 1.1. The tensor product exists.

Proof. Proceed to show this via introducing relations on the free group structure. Let $F := \mathbb{Z}^{M \times N}$ be a free abelian group with basis $\{e_{(u,v)} \mid (u,v) \in M \times N\}$. Quotient out the elements that are claimed to be equivalent by the constraint that the canonical map φ should be R-balanced: consider $G \subseteq F$ to be generated by the following elements:

- $(e_{u_1+u_2,v}-e_{u_1,v}-e_{u_2,v})$, for all $u_1,u_2\in M,v\in N$.
- $(e_{u,v_1+v_2}-e_{u,v_1}-e_{u,v_2})$, for all $u \in M, v_1, v_2 \in N$.
- $(e_{ua,v} e_{u,av})$ for all $u \in M, v \in N, a \in R$.

By construction it is clear that the canonical map $\varphi: M \times N \to M \otimes_R N$ is R-balanced, via specifying $\varphi(u,v) = \overline{e_{u,v}}$.

It suffices to verify that the construction is compatible with the universal property. Consider the R-balanced map $\psi: M \times N \to P$, with the group homomorphism $g: F \to P$ s.t. $g(e_{u,v}) = \psi(u,v)$:

• Existence. Applying the universal property of quotient groups, which implies that there exists a unique f s.t. $f \circ h = g$ where h is the induced group homomorphism of the quotient. This is indeed valid, as ψ is R-linear, which by construction has kernel G.

$$M \times N \xrightarrow{\varphi} F/G \longleftrightarrow_{h} F$$

$$\downarrow \downarrow f \qquad g$$

• Uniqueness. This follows from the result of universal property above; and the fact that φ is surjective.

Remark 1.3. The construction above, together with the fact that tensor products exist uniquely up to isomorphism, implies that for R-modules M and N with their system of generators, (u_i) and (v_i) respectively, for all $x \in M \otimes_R N$, there exists $(d_i) \in \mathbb{Z}$ s.t.

$$x = \sum_{i=1}^{n} d_i (u_i \otimes_R v_i)$$

where the multiplication by integers is simply adding repetitively the elements to itself.

The tensor products could also behave functorially, via composing with the canonical map of tensor product:

Let $f: M \to M'$ a morphism of right R-modules, and $g: N \to N'$ a morphism of left R-modules. Then one could define a map $\psi: M \times N \to M' \otimes_R N'$, where $(u,v) \mapsto f(u) \otimes_R g(v)$. The map is R-balanced since the canonical map of tensor product is R-balanced. Therefore it is valid to apply the universal property of tenbsor product, which gives a unique group homomorphism $f: M \otimes_R N \to M' \otimes_R N'$. This is uniquely determined by f and g; and is often denoted as $f \otimes_R g$.

Remark 1.4. This is also compatible with composition, via applying the universal property twice. Explicitly, for $f:M\to M',f':M'\to M''$ a morphism of right R-modules, and $g:N\to N',g':N'\to N''$ a morphism of left R-modules, we have

$$(f' \otimes g') \circ (f \otimes g) = (f' \circ f) \otimes (g' \circ g)$$

Remark 1.5. In particular the constructions above induces a functor $M \otimes -: {}_{R}\underline{\text{Mod}} \to \underline{\text{Ab}}$ for M a right R-module, where

$$N \in \mathrm{Ob}(_{R}\mathrm{Mod}) \mapsto M \otimes N, \qquad f: N \to N' \mapsto \mathrm{Id}_{M} \otimes f$$

Similar to the case of Hom Functors, we seek to lift the functor to ${}_R\underline{\text{Mod}} \to {}_R\underline{\text{Mod}}$. This requires extra structure on the module of interest. As before, making R commutative, and restricting M and N to be both R-modules could resolve the issue, but the condition is too strong.

2 Bimodule

Definition 2.1 (Bimodule). Let S and R be rings. An \mathbf{R} - \mathbf{S} bimodule M is given by an an abelian group M that is both a left S-module and a right R-module; and module operations is compatible, i.e.

$$(au)b = a(ub)$$
 $\forall u \in M, a \in S, b \in R$

Remark 2.1. If R is commutative, then every R-module is an R-R bimodule (which is why making R commutative suffices to ensure the Hom module has an R-module structure). Specifically, R is an R-R bimodule.

Remark 2.2. Morphisms between S-R bimodules inherits from corresponding modules. Compatibility does not interfere with morphisms.

Proposition 2.1. Let R and S be rings, with M an S-R bimodule, and N a left R-module. Then there exists a unique left S-module structure on $M \otimes N$ s.t. $\lambda \cdot (u \otimes v) = (\lambda u) \otimes v$, for all $\lambda \in S$, $u \in M$, $v \in N$.

Proof. Use the universal property, with $P=M\otimes N$. Fix $\lambda\in S$; consider $\varphi:M\times N\to M\otimes N$ s.t. $\varphi(u,v)=(\lambda u)\otimes v$. This map is R-balanced, as the tensor product on R is balanced.

Then by universal property there exists a unique group homomorphism $f_{\lambda}: M \otimes N \to M \otimes N, u \otimes v \mapsto (\lambda u) \otimes v$. This gives the scalar multiplication of λ , which induces an S-module structure on $M \otimes N$.

Proposition 2.2. The extra structure on the modules gives extra structure on the morphisms in the universal property:

Let M be a S-R bimodule, N a left R-module, and P a left S-module. Let $\varphi: M \times N \to M \otimes_R N$ the canonical map of tensor product. Suppose further that the map $\psi: M \times N \to P$ is S-bilinear. Then there exists a unique morphism of S-modules $f: M \otimes_R N \to P$.

Proof. By the universal property of tensor product, such morphism f exists, and is uniquely specified by $f(u \otimes v) = \psi(u, v)$. It suffices to check that this is indeed a morphism of S-modules, i.e. for all $a \in S$, $f((au) \otimes v) = af(u \otimes v)$. It then suffices to check that for certain (set of) fixed u and v, as every element in $M \otimes N$ is of such form. This is clear as

$$f((au) \otimes v) = \psi(au, v) \stackrel{!}{=} a\psi(u, v) = a \cdot f(u \otimes v)$$

Equality (!) requires that ψ is S-bilinear, and M being a bimodule ensures that this is well-formed under the context of S-modules.

Remark 2.3. The proposition above lifts the functor $M \otimes -$ to $R Mod \rightarrow S Mod$ for all S-R bimodule M.

Remark 2.4. It may be interesting to consider the following property of bimodules:

- 1. If R is commutative, then left or right R-modules are the same; and in this case $M \otimes_R N$ is an R-module.
- 2. If M is a T-R bimodule, and N is an R-S bimodule, then $M \otimes_R N$ is a T-S bimodule.

For the second remark, it is clear that $M \otimes_R N$ is both a left T-module, and a right S-module, via applying the same proof as in Proposition 2.1. It suffices to prove that they are compatible. This is also clear from the construction in the proposition referred:

$$(a(u \otimes_R v))b = (au \otimes v)b = (au) \otimes (vb) = a(u \otimes (vb)) = a((u \otimes v)b)$$

Remark 2.5. Let R be a ring. Then R is an R-R bimodule. Let M be a left R-module, which implies that $R \otimes_R M$ is a left R-module. Then there exists a functorial isomorphism $R \otimes_R M \simeq M$ for all $M \in \mathrm{Ob}(R \mathrm{Mod})$. (This is called functorial as this could be regarded as the property of functor $R \otimes_R - ...$)

Proof. Proof via using the universal property. Consider the morphism of R-modules $\alpha: R \times M \to M$, where $\alpha(a,u) = au$ for all $a \in R$, $u \in M$. It is R-linear, which is by definition R-balanced. The universal property gives that there exists a unique

 $f: R \otimes M \to M$ s.t. $f(a \otimes u) = au$. Designate $g: M \to R \otimes M$, $g(u) = 1 \otimes u$ for all $u \in M$. This is clearly R-balanced. This gives an isomorphism as $g \circ f = \mathrm{Id}_{R}$, $f \circ g = \mathrm{Id}_{R \otimes M}$.

3 Extension of Scalar

Let S and R be rings, together with a ring homomorphism $\varphi: R \to S$. Then

1. It is clear that there is a *restriction of scalar* functor:

$$F: {}_{S}\mathsf{Mod} \to {}_{R}\mathsf{Mod}, \quad {}_{S}M \to {}_{R}M \qquad \text{where } a \cdot u := \varphi(a) \cdot u \ (\forall a \in R, u \in {}_{S}M)$$

- 2. It is more interesting to consider the extension of scalar functor $G: {}_R\underline{\mathsf{Mod}} \to {}_S\underline{\mathsf{Mod}}$. Notice that φ gives S a natural R-module structure, where $rs := \varphi(r)s$ for all $r \in R, s \in S$. This gives a natural extension of scalar functor $(S \otimes_R -)$:
 - For $M \in \mathrm{Ob}(R\mathrm{Mod})$, this gives $S \otimes_R M$.
 - For $f: M_1 \to M_2$ a morphism of R-modules, this gives $\mathrm{Id}_S \otimes f$.

Example 3.1. Consider the following examples:

• Let $\varphi: R \to R/I$ the canonical quotient map. Then this induces the isomorphism $G(M) \simeq M/IM$.

Extension of scalar gives $G(M) \simeq R/I \otimes M$. To show that these two left R/I-modules are isomorphic, it suffices to specify maps between them s.t. the composition gives identity. Consider

$$f: R/I \otimes M \to M/IM, \quad \overline{r} \otimes u \mapsto \overline{ru}, \qquad g: M/IM \to R/I \otimes M, \overline{u} \mapsto 1_{R/I} \otimes u$$

It is clear that $f \circ g = \mathrm{Id}_{R/I \otimes M}$. Notice

$$g \circ f(\bar{r} \otimes u) = g(\overline{ru}) = 1 \otimes \overline{ru} = 1 \otimes \bar{r} \cdot \bar{u} = \bar{r} \otimes \bar{u}$$

since the canonical map of tensor product is R-balanced.

• Let R be a ring, and $S \subseteq R$ a multiplicative system. Let φ be the canonical map $R \to S^{-1}R$, $\varphi(a) = \frac{a}{1}$. Then this induces an isomorphism $G(M) \simeq S^{-1}M$.

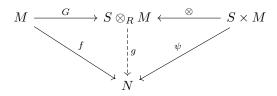

Apply the similar strategy. It suffices to show that $G(M) = S^{-1}R \otimes M \simeq S^{-1}M$. Consider

$$f: S^{-1}R \otimes M \to S^{-1}M, \quad \frac{r}{s} \otimes u \mapsto \frac{ru}{s}, \qquad g: S^{-1}M \mapsto S^{-1}R \otimes M, \quad \frac{u}{s} \mapsto \frac{1}{s} \otimes u$$

It is clear $f \circ g(\frac{u}{s}) = f(\frac{1}{s} \otimes u) = \frac{u}{s}$. For the other direction, check

$$g \circ f(\frac{r}{s} \otimes u) = g(\frac{ru}{s}) = \frac{1}{s} \otimes (ru) = \left(\frac{1}{s}\right) \cdot r \otimes u = \frac{1}{s} \cdot \frac{r}{1} \otimes u = \frac{r}{s} \otimes u$$

Theorem 3.1 (Universal Property of Extension of Scalars). Let M be a left R-module, N be a left S-module, together with a ring homomorphism $\varphi: R \to S$. Let $f: M \to N$ a morphism of R-modules (in the sense of restriction of scalars). Then there exists a unique morphism of S-modules $g: S \otimes_R M \to N$ s.t. $g(1 \otimes u) = f(u)$ for all $u \in M$:

Proof. Construct using the universal property of tensor product. Since f is a morphism of S-modules, it is in particular S-linear, i.e.

$$f(su) = sf(u) \implies \psi(s, u) = sf(u)$$

There exists a canonical morphism into the setting of universal property, as $G(su) = \otimes(1, su) = \otimes(s, u)$ for all $s \in S, u \in M$; and ψ is R-linear:

$$\psi(sr, u) = (s\varphi(r))f(u) = s(\varphi(r)f(u)) = sf(\varphi(r)u) = \psi(s, ru)$$

$$\psi(ss', u) = ss'f(u) = sf(s'u) = \psi(s, s'u)$$

Then the strengthened version of universal property gives the desired result.

Remark 3.1. Functorially, for tensor products we have the natural transformation (given the ring homomorphism $\varphi: R \to S$)

$$\operatorname{Hom}_S(S \otimes_R M, N) \to \operatorname{Hom}_R(M, N), \qquad g \mapsto (u \mapsto g(1 \otimes u))$$

The universal property gives that this is actually a bijection. Since $\operatorname{Hom}_R(M,N)$ is in essence the restriction of scalar, there is a bijection (which is exactly rephrasing the result above)

$$\operatorname{Hom}_S(G(M), N) \simeq \operatorname{Hom}_R(M, F(N))$$

Definition 3.1 (Adjoint Pair). Consider functors $F : \mathscr{C} \to \mathscr{D}$, $G : \mathscr{D} \to \mathscr{C}$. They form an **adjoint pair** (F, G) if for all $a \in \mathrm{Ob}(\mathscr{C})$ and $b \in \mathrm{Ob}(\mathscr{D})$, we have a bijection $\mathrm{Hom}_{\mathscr{C}}(G(b), a) \simeq \mathrm{Hom}_{\mathscr{D}}(b, F(a))$ which is functorial w.r.t. both a and b, i.e. there exists a natural transformation from $\mathrm{Hom}_{\mathscr{C}}(G(-), a)$ to $\mathrm{Hom}_{\mathscr{D}}(-, F(a))$.

Remark 3.2. Extension of scalar functor G and restriction of scalar functor F form an adjoint pair.

4 General Properties of Tensor Product

Proposition 4.1. Tensor product is commutative, i.e. there exists an isomorphism of abelian groups $M \otimes_R N \simeq N \otimes_{R^{op}} M$. Similarly, if R is commutative, then this is an isomorphism of R-modules.

Proof. Proceed via using the universal property of tensor product. Consider the map $\varphi: M \times N \to N \otimes_{R^{op}} M$ given by $\varphi(v,u) = u \otimes_{R^{op}} v$. It is clear φ commutes with addition in either field. To show that φ is indeed R-balanced it suffices to check the third property, which gives

$$\varphi(va,u) = u \otimes_{R^{op}} (va) = u \otimes_{R^{op}} a^{op}v = ua^{op} \otimes_{R^{op}} v = (au) \otimes_{R^{op}} v = \varphi(v,au)$$

Similarly there exists an R-balanced map $\tilde{\psi}: N \times M \to M \otimes_R N$ (as R^{op} modules) which is given by $\psi(u,v) = v \otimes u$. This induces a map $\psi: N \otimes_{R^{\mathrm{op}}} M \to M \otimes_R N$. It is clear that $\varphi \circ \psi = \mathrm{Id}_{N \otimes_{R^{\mathrm{op}}} M}, \psi \circ \varphi = \mathrm{Id}_{M \otimes_R N}$.

Remark 4.1. If R is commutative, then the left R-modules are the same as right R-modules, which indicates that $M \otimes_R N \simeq N \otimes_R M$ (as in the commutative setting the opposite ring is the same as the original ring).

Proposition 4.2. Tensor product is associative, i.e. for M a right R-module, N an R-S bimodule, and P a left S-module, there exists a unique isomorphism $f:(M\otimes_R N)\otimes_S P\to M\otimes_R (N\otimes_S P)$ s.t. $f((u\otimes_R v)\otimes_S w)=u\otimes_R (v\otimes_S w)$.

Proof. Apply the universal property of tensor product twice. First consider map $f_z: M \times N \to M \otimes_R (N \otimes_S P)$ given by $f_z(x,y) = x \otimes_R (y \otimes_S z)$ for some $z \in P$. f_z is R-balanced, as for all $a \in R$,

$$f_z(x, ay) = x \otimes_R (ay \otimes_S z) = x \otimes_R a(y \otimes_S z) = (xa) \otimes_R (y \otimes_S z) = f_z(xa, y)$$

By universal property of tensor product this gives a unique map $\tilde{f}_z: M \otimes_R N \to M \otimes_R (N \otimes_S P)$, $f_z(x \otimes y) = x \otimes (y \otimes z)$. Now consider the map $f: M \otimes_R N \times P \to M \otimes_R (N \otimes_S P)$ given by $f(x \otimes y, z) = f_z(x, y)$. This is S-linear, as for all $a \in S$,

$$f((x \otimes y)a, z) = f((x \otimes ya), z) = x \otimes (ya \otimes z) = x \otimes (y \otimes (az)) = f((x \otimes y), az)$$

Similarly this gives a unique map $\tilde{f}: (M \otimes_R N) \otimes_S P \to M \otimes_R (N \otimes_S P)$. Repeat the process in the converse direction gives the inverse map, and it is clear that the composition of them is identity in the corresponding structure.

Proposition 4.3. Let R be a commutative ring, and $f_1: R \to S_1$ and $f_2: R \to S_2$ be two R-algebras. Then there is a unique R-algebra structure on $S_1 \otimes_R S_2$ s.t.

$$(u_1 \otimes v_1) \cdot (u_2 \otimes v_2) = (u_1 u_2) \otimes (v_1 v_2)$$

Proof. Since we are in the commutative setting, by using the associativity and commutativity of tensor product, there is an isomorphism $\Phi: (S_1 \otimes S_2) \otimes (S_1 \otimes S_2) \simeq (S_1 \otimes S_1) \otimes (S_2 \otimes S_2)$. By universal of property of $S_1 \otimes S_1$ and $S_2 \otimes S_2$, there exists a unique morphism of R-module $f_i(a_i \otimes b_i) = a_ib_i$ for all i. This gives $f_1 \otimes f_2: (S_1 \otimes S_1) \otimes (S_2 \otimes S_2) \to S_1 \otimes S_2$, which indicates that there is a unique map $f_1 \otimes f_2 \circ \Phi$ that maps $(S_1 \otimes S_2) \otimes (S_1 \otimes S_2) \to S_1 \otimes S_2$. Composing this with the tensoring of $(S_1 \otimes S_2)$ with itself gives the desired result.

Proposition 4.4. There exists an isomorphism of abelian groups $\Phi : \operatorname{Hom}_S(M \otimes_R N, P) \simeq \operatorname{Hom}_R(N, \operatorname{Hom}_S(M, P))$ for N a left R-module, P a left S-module, and M an S-R bimodule.

Proof. The only natural way to define this isomorphism is via $\Phi(\varphi) = (N \mapsto (M \mapsto \varphi(M \otimes N)))$, where for $f \in \text{Hom}_S(M, P)$, $a \in R, u \in M, af(u) := f(ua)$. By construction this is a bijection, and additivity is satisfied in P.

Remark 4.2. This indicates that $M \otimes_R -$ and $\operatorname{Hom}_S(M, -)$ form an adjoint pair for M being a S-R bimodule. Furthermore, if $f: R \to S$ gives an R-algebra structure, then taking M = S gives the adjoint pair of extension/restriction of scalar functors.
